

The Great Agent Hackathon

Build Great Products with a Great Business Case

Every section below has a short prompt telling you what to cover, plus a worked EXAMPLE using a made-up product called "SnapNotes" — an AI add-on that automatically summarizes meeting notes inside a generic project management tool called "TaskFlow". Use those examples as a guide, keep each answer short (a business case should be readable — or presentable — in 10 minutes, not 10 pages). Come prepared on each of these headers — then turn your answers into a couple of slides you can walk a reviewer through.

1. Initiative Overview

Initiative Name & Owner

What is the name of your product/feature idea, and who owns this proposal?

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

Initiative: SnapNotes — AI Meeting Notes Add-on for TaskFlow

Owner: Priya Shah, Product Analyst Intern

2. Problem Statement

What problem are we solving?

Describe the problem in 3-5 sentences. Who has this problem? How big or painful is it? Why does it matter right now?

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

TaskFlow users hold most of their planning meetings inside the app's video-call feature, but nobody has time to write notes during the call.

As a result, action items get forgotten and team members ask 'wait, what did we decide?' days later.

This is a common complaint in user support tickets and a top reason cited for switching to competitor tools that already offer note summaries.

3. Why Now (Rationale)

Why should we build this now?

Give 2-3 short reasons this is worth doing today: market trend, competitor gap, customer request volume, technology now available, etc.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- AI meeting-summary tools have become cheap and accurate enough to build in-house at low cost.
- Two direct competitors already ship a similar feature, so TaskFlow risks losing customers who expect it.

- Customer support logged 240 feature requests for 'automatic meeting notes' in the last 6 months.

4. Competitive Landscape

Who else solves this problem?

List 2-3 alternatives customers use today — direct competitors, indirect workarounds, or "do nothing." Note one strength and one gap for each, and how you'll be different.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- Otter.ai — strong standalone transcription, but not integrated into project/task tools like TaskFlow
- Competitor PMTool X — already bundles AI meeting notes, main reason we're seeing switch requests
- Do nothing (manual notes) — free, but slow and inconsistent, which is the core problem we're solving
- Our edge: notes and action items land directly on the TaskFlow board, so there's no export/copy-paste step

5. Proposed Solution

What are we proposing to build?

Describe the solution in plain language. What does it do? What's in scope for a first version (MVP) vs. later phases? How does it adopt Freshworks and integrate (or built as part of) Freshworks' products. Does it have AI and agentic design?

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

SnapNotes automatically listens to a TaskFlow video call, generates a written summary, and creates action-item tasks directly on the project board.

MVP (Phase 1): auto-summary + action items for English-language calls.

Later phases: multi-language support, searchable meeting history, integration with calendar reminders.

Freshworks' adoption: Integrates with Freshcaller in Freshdesk Omni to provide summarized notes of the call.

AI Adoption: AI summarization, AI based help prompting/context cues during call

6. Target Customers (Who is this for?)

Who will use this feature?

Describe your ideal customer in 1-2 sentences: company size, role, or use case. Keep it specific.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

Primary: small-to-mid-size teams (10-200 employees) already on a paid TaskFlow plan who hold 3+ video meetings per week.

Secondary: individual freelancers using TaskFlow's free plan who may upgrade to get this feature.

7. Value Proposition

Why will customers want this?

In one or two sentences, explain the main benefit to the customer, and why they would choose this over doing nothing (or using a competitor).

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

Teams save 20-30 minutes per meeting on manual note-taking and stop losing track of action items — without leaving the TaskFlow app they already use.

8. Pricing & Packaging

How will we charge for it?

Will this be free, a paid add-on, bundled into an existing plan, or a new tier? Keep the pricing logic simple.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

SnapNotes will be a paid add-on (\$4 per user/month) available to customers on TaskFlow's Team and Business plans.

First 14 days free as a trial to encourage adoption.

9. Go-to-Market Plan

How will customers find out about it?

How will you launch and promote this? Think: in-app announcement, email, sales outreach, free trial, etc.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- In-app banner announcing the new feature to eligible customers
- Email to existing Team/Business plan customers with a 14-day free trial offer
- Short demo video posted on the product blog and social media

10. Costs & Resources Needed

What will it cost to build?

Give a rough estimate of the team, time, and money needed. It's OK to keep this high-level — the goal is to show you've thought about feasibility.

Optional: If you have a revenue or ARR estimate, you can add it here too — this is a bonus, not a requirement. Skip it if you don't have reliable numbers yet.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- Team: 2 engineers + 1 designer, part-time PM support
- Timeline: 3 months to MVP
- Estimated cost: ~\$60,000 (salaries + AI transcription service fees)
- (Optional) Revenue / ARR estimate: ~\$50,000 in add-on revenue in Year 1, based on 20% attach rate

11. Expected Benefits & Success Metrics

How will we know it worked?

List 2-4 simple, measurable metrics you'll track after launch, with a target if possible.

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- Adoption: 20% of eligible customers activate SnapNotes within 3 months
- Retention: 5% reduction in churn among customers who use the feature
- (If tracked) Revenue: \$50,000 in new add-on revenue within the first year

12. Risks & Assumptions

What could go wrong or is unproven?

Name 2-3 key risks or assumptions your case depends on (technical, market, or financial).

EXAMPLE — SnapNotes (AI Meeting Notes Add-on for TaskFlow)

- Assumes AI transcription accuracy is high enough not to frustrate users at launch
 - Risk: customers may be hesitant about privacy of AI-recorded meetings
 - Assumes 20% of eligible customers will try a paid add-on within 3 months
-
